Admin Dashboard App Integration Gaps

An honest gap assessment against every section of the "Detailed Admin Panel" specification.

> **Assessment date:** 16 October 2026
> **Scope:** admin website, backend API/database, customer app and partner app
> **Purpose:** show what is partial, configuration-only or not yet integrated—without demo data or inflated completion claims.

Executive summary

The core operational path is connected: real orders, drivers, customers, KYC, vehicle pricing, payouts, coins, cancellations, push delivery, reports and basic B2B operations. However, the full 21-section specification is **not yet completely integrated**.

Most important gaps: service-area enforcement, runtime settings enforcement, real multi-admin authorization, full support/in-app notification integration, advanced refund processing, complete audit coverage, document-expiry data, advanced analytics, and full B2B contract/invoice/payment workflows.

Status definitions

- **CONNECTED** works through app/backend/database and is covered in the completed-feature guide.
- **PARTIAL** some functionality exists, but important requirements or app-side effects remain.
- **NOT INTEGRATED** visible configuration or requested workflow does not yet control the customer/partner apps or backend runtime.

High-priority integration work

Priority	Gap	Why it matters	Required integration
P0	Service areas are records only	Pausing a zone does not block customer quotes/bookings or driver offers.	Dedicated service-area model/API, geofence checks in quote/order creation, app availability messages.
P0	Settings are not runtime rules	Maintenance, auto-assign, wallet floor, pickup radius, re-KYC and 2FA toggles do not change app behavior.	Validated settings schema, backend rule consumption, mobile-app behavior and safe rollout.
P0	Admin users are access records only	Adding/deactivating a row does not provision or revoke a real administrator login.	Admin identity model, invitations/reset, role/city permissions, endpoint authorization and login history.
P1	Refund workflow is read-only	Recorded cancellation refunds can be viewed, but admin approval/processing is not a real gateway workflow.	Refund model/state machine, Razorpay/UPI/wallet integration, idempotency, receipts and failure handling.
P1	Support records are not app inboxes	Customer/driver apps cannot open, respond to or receive ticket updates.	Support-ticket model, attachments/media, threaded messages, app screens and push events.
P1	In-app announcements absent	Only push campaigns are implemented.	Announcement model, targeting/read-state APIs and customer/partner app surfaces.
P1	B2B billing is basic	No persistent invoices, payment receipts, credit notes, due-date workflow or reconciliation ledger.	Invoice/payment models, numbering, PDF invoices, allocations and payment reconciliation endpoints.

Gap matrix — original sections 1 to 10

#	Specification	Status	What remains
1	Dashboard	PARTIAL	Exact “today” cards, document-expiry/re-KYC alerts and delayed pickup/delivery alerts need dedicated backend queries. Current live totals and financial aggregates are real.
2	Driver Management	PARTIAL	Missing document expiry, submission/review waiting duration, full rejection-history list, acceptance rate, per-driver completed-delivery aggregate and pagination.
3	Individual Driver Profile	PARTIAL	No profile-photo/address fields in the current view, complete login/activity history, complaint linkage, acceptance rate or delivery-time performance. Bank and booking data are available where stored.
4	Customer Management	PARTIAL	No verified-contact flag, complete wallet ledger inside the customer drawer, linked support/refund history, suspicious-activity engine, complaint filter or server pagination.
5	Live Tracking & Dispatch	PARTIAL	Manual assignment works, but reassignment, driver contact action, distance-from-pickup ranking, delay detection and vehicle-type map filtering are incomplete.
6	Vehicle Management	PARTIAL	No separate vehicle-record CRUD, model/chassis details, document expiry dates, individual document review history or explicit inactive/restricted vehicle workflow independent of the driver.
7	Payments & Transactions	PARTIAL	Payment/refund records are visible, but real admin refund initiation/approval/processing, failed payout retry and automatic bank payout are not implemented.
8	Wallet Management	PARTIAL	Coins are integrated; a separate customer cash-wallet ledger/top-up flow and configurable outstanding-balance booking block are not fully implemented.
9	Pricing & Charges	PARTIAL	Base/per-km/share/ETA/active are connected. Minimum fare, taxes, promo codes, service-area pricing and admin-managed waiting/cancellation rules remain hardcoded or absent.
10	Cancellations & Disputes	PARTIAL	Core cancellation data is real. Admin-initiated attribution, exception approval, dedicated dispute entities, driver daily count reporting and a full resolution audit trail need backend models.

Gap matrix — original sections 11 to 21

#	Specification	Status	What remains
11	Complaints & Support	PARTIAL	Admin-created records work, but app-created tickets, attachments, message thread, internal notes persistence, SLA/escalation automation and closure reason are not integrated.
12	Notifications	PARTIAL	Immediate push campaigns are connected. In-app announcements, scheduled campaigns, reusable templates, transactional log aggregation and receipt-status follow-up UI remain.
13	Reports & Analytics	PARTIAL	Basic filtered metrics and CSV exist. Missing zone/vehicle trends, growth series, per-driver productivity, cancellation rates, rating distribution, detailed liabilities/refund/payout reports and Excel format.
14	Service Areas & Cities	NOT INTEGRATED	Records can be saved, but they do not enforce pickup/drop coverage, vehicle availability, hours, routing, area pricing, city manager permissions or app booking availability.
15	Admin Users & Permissions	NOT INTEGRATED	Rows are administrative records only. No account invitation, deactivation enforcement, RBAC, city scope, secure reset, login history or endpoint-level permission checks.
16	Settings & Audit Logs	PARTIAL	Values and selected action records persist, but most settings do not affect runtime. Audit coverage is not centralized, immutable or complete across all specified actions.
17	B2B Business Partners	PARTIAL	Basic client create/list works. Missing logo, brand/legal split, industry, PAN/documents, billing contact/address, manager, contract reference, internal notes, verification and robust filtering/pagination.
18	Individual Business Profile	PARTIAL	No full tabbed profile, verification history, authorized contacts, complaints/activity log or editable negotiated pricing/contract workflow.
19	B2B Driver Assignment	PARTIAL	Assignment works. Reassignment/cancel assignment, distance ranking, recent performance, assignment-request response, contact-driver action and B2B-specific ETA workflow remain.
20	B2B Orders	PARTIAL	Dedicated list and main-order access work. Missing date-range/vehicle/business/payment compound filters, pagination and some full timeline/payment detail views.
21	Business Billing	PARTIAL	Outstanding/order statement is available. Persistent numbered invoices, due dates, receipts, credit notes, adjustments, payment allocation and reconciliation are not integrated.

Detailed app-side gaps

Customer app

- No service-zone/operating-hours response that disables booking and explains why.
- No maintenance-mode banner or booking lock controlled by admin settings.
- No support-ticket inbox, ticket creation, attachments or threaded responses.
- No in-app announcement feed/read-state.
- No explicit admin-configured wallet-floor rule synchronized from settings.
- No B2B-authorized contact experience; B2B dispatch remains admin-led.

Partner app

- No re-KYC interval or document-expiry reminders driven by admin-configured dates.
- No service-zone/vehicle availability policy driven by admin records.
- No admin support-ticket conversation or escalation UI.
- No in-app announcement feed.
- No configurable pickup search radius or assignment policy consumed from the settings module.

Backend platform

- No single validated runtime-settings service with versioning and cache invalidation.
- No real RBAC matrix; current admin middleware authorizes the admin role broadly.
- No centralized immutable audit-event model capturing actor, request, before/after and outcome.
- No support, announcement, service-area, invoice, refund-request or business-document domain models.
- No scheduled job layer for document expiry, campaigns, invoice due dates or re-KYC.

Recommended delivery plan

Phase 1 — runtime controls and authorization

- ☐ Create validated system-settings and service-area schemas.
- ☐ Enforce maintenance, coverage, hours, wallet floor and search radius in backend APIs.
- ☐ Add mobile app banners/errors for each enforced condition.
- ☐ Implement real admin identities, invitations, deactivation and role/city permissions.
- ☐ Add centralized audit events to every privileged mutation.

Phase 2 — financial and support workflows

- ☐ Build gateway-backed refund requests with idempotent provider calls.
- ☐ Build support tickets, attachments, threads, SLA and customer/partner app screens.
- ☐ Build in-app announcements with targeting and read state.
- ☐ Add document expiry dates, reminder jobs and re-KYC lifecycle.

Phase 3 — B2B and advanced intelligence

- ☐ Expand business profiles, verification, contracts and authorized contacts.
- ☐ Add persistent invoices, due dates, receipts, credits and reconciliation.
- ☐ Add advanced report APIs, pagination and Excel exports.
- ☐ Add assignment distance/performance ranking and delay monitoring.

Production-completion checklist

A feature should be marked fully integrated only when all relevant checks below are satisfied:

- ☐ Backend has a validated model and authorized API.
- ☐ Admin action changes persistent application state.
- ☐ Customer and/or partner app consumes the state where required.
- ☐ The user receives a clear result or error.
- ☐ The action is auditable with actor, time and outcome.
- ☐ Empty/error/loading states are implemented.
- ☐ Tests cover authorization, validation and failure recovery.
- ☐ No placeholder records, invented totals or misleading provider status exist.

Current conclusion: core operations are usable and connected, while the gaps listed in this report must be completed before the entire original admin-panel document can accurately be declared fully integrated.

End of integration-gap report.
